**CT OF THE ABDOMEN & PELVIS W/O CONTRAST**

---

**TECHNIQUE:**

Electron beam tomography was performed with multiple axial images taken through the abdomen and pelvis. No contrast was used. Comparison is made to 10/20/2011.

**FINDINGS:**

The liver is normal in size with no evidence of fatty infiltration or mass. The spleen, biliary tree, gallbladder, pancreas, kidneys, and adrenal glands are unremarkable. There is no lymphadenopathy. There is no free fluid in the abdomen or pelvis. There is mild calcific atherosclerosis. No aortic aneurysm is seen.

Evaluation of the bowel shows no obstruction/ileus or mass. There is a 2.5cm hiatal hernia. No inflammatory changes are seen in the mesentery. There is slight fullness and subtle heterogeneity in the uterus.

There is mild multilevel degenerative changes in the lumbar spine with grade I spondylolisthesis at L5-S1.

**IMPRESSION:**

1. Small hiatal hernia, new from 2011.
2. Minimal calcific atherosclerosis.
3. Grade I spondylolisthesis at L5-S1, unchanged.
4. Subtle heterogeneity in the uterus. This may be within normal limits, however the possibility of fibroids cannot be entirely ruled out. Note that uterine pathology can be difficult to evaluate accurately on CT, and further evaluation with a pelvic ultrasound is suggested.
